David Michael Rorvik is a science journalist who publicized advancements in the field of reproductive medicine during the late twentieth century. Rorvik wrote magazine articles and books in which he discussed emerging methods and technologies that contributed to the progression of reproductive health, including sex determination, in vitro fertilization, and human cloning. During that time, those topics were controversial and researchers often questioned Rorvik’s work for accuracy. Rorvik contributed to the field of reproductive medicine by communicating methods of reproductive intervention and contributing to the controversy around new developmental medicine technologies.

Rorvik was born on 1 November 1944 in Circle, Montana, to Frances Rorvik and Alan Rorvik. In 1962, he enrolled at the University of Montana in Missoula, Montana, where he majored in journalism. During his undergraduate career, Rorvik worked as a reporter and editor of the student-run newspaper, which was segregated under the government at that time. Upon returning to Time in New York, Rorvik shifted his focus to science writing and worked as a medical reporter for the next two years. In the early 1969, he left Time and began freelance writing.

In May 1969, Rorvik published an article in New York Magazine titled “Your Baby’s Sex: Select, Don’t Settle.” In that article he wrote about Landrum Shettles, a physician who specialized in obstetrics and gynecology, who are studies of women’s reproductive health. At the time, Shettles worked at Columbia University and was conducting research on sex determinants of sperm [9]. He looked at how male sperm [9] cells contributed to the sex of the developing fetus [9]. In “Your Baby’s Sex: Select, Don’t Settle” Rorvik describes how Shettles developed a method that reportedly enabled couples to directly affect the probability of producing a male or a female child prior to conception [9]. According to Rorvik, Shettles claimed that he could accurately predict the sex of a child by observing the size and mobility of male sperm [9] cells that would potentially fertilize the female egg [9]. One year later in 1970, Rorvik and Shettles co-authored the book titled Your Baby’s Sex: Now You Can Choose which they elaborated on the methods that would ultimately enable couples to choose the sex of their fetus [9]. The book consists of various tips for couples to utilize during intercourse to increase their odds of producing a male [9] of the desired sex.

In 1971, Rorvik published his own book titled Brave New Baby: Promise and Perils of the Biological Revolution. In that book, Rorvik states that mankind will inevitably alter the course of human evolution through the use of contraceptives. He describes how birth control [9] can be used to combat a lack of resources, which, according to Rorvik, contributes to the rapid increase in human population. By selectively enforcing the use of contraceptives, humans [9] would shift the course of evolution [9] to their desire. Rorvik suggests that, if evolutionary processes did not occur naturally and reproductive processes were disrupted, humans [9] would have the ability to radically increase life span and utilize drugs to enhance intelligence. The claims Rorvik makes in Brave New Baby: Promise and Perils of the Biological Revolution began this contribution to the writings on the future of reproductive health.

In addition to writing his own books, Rorvik often co-authored publications with physicians and researchers on their methodologies. In 1973, Rorvik co-authored a book titled Decompression Babies with O.S. Heyns, a physician who specialized in obstetrics and gynecology in South Africa. In that book, the authors present the benefits of sexual and abdominal decomposition, which is a method that reduces the atmospheric pressure on a pregnant woman’s abdomen to increase blood flow, and therefore access to oxygen and nutrients for the fetus [9]. The book demonstrates how this method can prevent the development of mother’s high blood pressure during pregnancy [9], premature birth of the infant, and labor endangerment for both mother and child. At the time of publication, more than 10,000 healthy infants were safely born to mothers who used decomposition methods during pregnancy [9].

On 15 September 1974, Rorvik published an article in The New York Times titled “The Embryo Sweepstakes,” in which he questions the news of the first successful human cloning in vitro fertilization. In vitro fertilization is a technique in which the egg and sperm are combined outside of the body of an organism to create an embryo in a laboratory setting. In that article, Rorvik describes how Douglas Bevis, a physician and researcher at Leeds University in Leeds, United Kingdom, gave a presentation on embryo implantation, the process of implanting an embryo created with in vitro fertilization into a female. Earlier that year, at the British Medical Association conference, Bevis claimed that three embryos were created in test tubes and successfully implanted in the wombs of three women. He also claimed that all three pregnant women gave birth to healthy infants who were developing normally. In his article, Rorvik states that other than the press release, Bevis offered no further information on the matter and did not attribute work to anyone, including himself. In “The Embryo Sweepstakes” Rorvik states that Bevis’s claims were fraudulent due to the lack of information. Rorvik also describes the work of two physicians from the UK who contested Bevis – Patrick Stepleton [9] and Robert Edwards [9]. They were leading the field of reproductive intervention at the time. Some predicted that Stepleton and Edwards would be the first to accomplish human embryo implantation [9]. Rorvik notes that Stepleton discredited Bevis because his claims were not supported by scientific evidence.

In 1967, Rorvik received the Alicia Patterson Foundation Fellowship to study the politics of cancer research in the US. At the time, few journalists were invited to this award that amounted to $3,000, which enabled him to pursue independent projects on their topic of choice. With the fellowship, Rorvik traveled around the world and investigated the politics of cancer research in different countries. He published his work in The AFR Reporter, a quarterly magazine by the Alicia Patterson Foundation.

Despite the fact that Rorvik was a widely read-in the reproductive health field, the researchers often questioned the validity of his work. In 1978, Rorvik published a nonfiction book titled His Image: The Cloning of a Man, in which he describes the successful scientific endeavor of cloning a human. In that book, Rorvik states that a group of researchers attempting to clone a man recruited him to report on the project. Rorvik’s claims caused a debate within the scientific community on whether or not cloning was realistically possible. Many scientists, who had previously claimed that human cloning was harmless and that the cloning technology could be utilized in the near future, were publicly dismantling the possibility.

On 11 May 1978, Synapse, the student-run newspaper at the University of California San Francisco in San Francisco, California, published a first statement that Rorvik made in response to the adverse reaction of patients to his book. In his article, The Cloning of a Man In that statement, Rorvik defends all claims and protects the identities of the individuals in the book. He also questions the motives of the scientists, who once supported human cloning, but began speaking out about the dangers and difficulties of the process once Rorvik’s claims were publicized.

Shortly after publishing His Image: The Cloning of a Man, Rorvik and his publisher, J.B. Lipincott Company, were charged with a $7 million defamation suit because of the claims made in the book. Derek Bromhall, a British scientist who at the time conducted research on cloning, brought the suit against Rorvik. Bromhall claimed that Rorvik copied the methods described in the book from Bromhall’s dissertation without permission. In a pretrial ruling, the judge said the book was a hoax because Rorvik refused to provide the real names of his sources. The lawsuit lasted four years until July 1982, when Bromhall reached a settlement of $100,000. J.B. Lipincott Company publicly addressed the lawsuit and announced that they deemed Rorvik’s book was fraudulent. Despite the outcome, Rorvik maintains that the book is legitimate.

In 1983, Rorvik founded a literary agency called Proteus, Inc. and as of 2018 maintains his role as President. He co-authored a second book with Shettles later that year titled Rites of Life: Scientific Evidence for Life Before Birth, in which they present the argument that developing embryos are living beings and have certain rights. Year 2006 marked the thirty-fifth consecutive year of print Your Baby’s Sex: Now You Can Choose. The book consists of various tips for couples to utilize during intercourse to increase their odds of producing a male [9] of the desired sex.
