Editor's note:

Chanapa Tantibanchachai defended her thesis titled "Substance-Exposed Newborns in Arizona: An Analysis of Medically, Ethically, and Legally Appropriate Federal and State Responses" in April 2015 in front of committee members Jane Maienschein, Karin Ellison, and Cristi Coursen earning her a Master of Science degree. <https://repository.asu.edu/items/29965> ^[4]

Abstract:

Intake of alcohol, tobacco, and illicit substances such as marijuana and methamphetamine during [pregnancy](#) ^[5] can have significant deleterious effects on a developing [fetus](#) ^[6] and the resulting infant. The existence of substance-exposed newborns also has negative impacts on society as a whole; these include financial burdens placed on taxpayers and the additional time and resources required by health care professionals, social workers, and law enforcement authorities to properly care for such infants. Existing literature show a strong correlation between prenatal care and improved birth outcomes, including abstinence from or [reduction](#) ^[7] of prenatal substance abuse.

The Health Start Program in the state of Arizona attempts to mitigate the incidence of substance-exposed newborns, among other goals, by employing community health workers who identify high-risk pregnant and postpartum women, inform these women about how to receive prenatal care services, educate them on appropriate prenatal and neonatal care, and provide program and referral services to both pregnant and postpartum women. Community health workers interact directly with women most at-risk for prenatal substance abuse and should be well-versed in the understanding of the complex issues related to substance-exposed newborns.

In an attempt to discover, analyze, and compile those complex issues with which community health workers should be knowledgeable, this project explores existing federal regulations regarding substance-exposed newborns, compares Arizona's regulations to Minnesota's, Virginia's, and Washington's, and analyzes prevailing literature in the field about the various implications associated with screening and reporting substance-exposed newborns to law enforcement authorities. After an intensive literature review, this project concludes that the Health Start Program needs a comprehensive resource document which enumerates federal and select state policies, landmark cases involving substance-abusing pregnant women and the precedence set by each, and recommendations from medical and public health experts. The document should also provide clear guidelines by which each stakeholder should abide and why, and recommend potential best practices the state of Arizona could adopt into law based on other state policies which have proven to be effective.

In an attempt to discover, analyze, and compile those complex issues with which community health workers should be knowledgeable, this project explores existing federal regulations regarding substance-exposed newborns, compares Arizona's regulations to Minnesota's, Virginia's, and Washington's, and analyzes prevailing literature in the field about the various implications associated with screening and reporting substance-exposed newborns to law enforcement authorities.
